

Research

SweTree Technologies is continuously active in generating new technologies to improve the commercial value of tomorrow's forestry and forest based products.

The research and innovation assets of SweTree Technologies emanate from three sources, from which the company's intellectual property, applications and products are developed:

- Research generated by Woodheads AB
- In-house research through the Gene Discovery Platform
- Innovations within specific application areas, emanating both from internal and external research (see Application Areas)

The unique collaboration with Woodheads AB gives SweTree Technologies access to discoveries from a broad field of plant and forestry research as well as fiber based materials research that can be patented and commercialized.
